The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified denovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents a El/fiber-expressing plasmid, which was used for complementation of El/fiber-gene deleted adenoviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid comprising for producing high-capacity

Polynucleotide for making vectors, useful for treating ocular diseases, e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat sequences, packaging signal and photoreceptor-specific promoter.

Example 1; Page 114-118; 149pp; English.

The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal CC (AV) inverter terminal repeat sequences (ITRS), AV packaging signal CC operatively linked to ITRS and a photoreceptor-specific promoter. A CC recombinant AV vector (AVV) comprising the polynucleotide is useful for the cy citreous cavity), for treating an ocular disease, e.g., retinal CC vitreous cavity), for treating an ocular disease, e.g., retinal CC retinopathies, retinal vascularizations, and retinoblastoma, of a mammal CC retinopathies, retinal vascularizations, and retinoblastoma, of a mammal CC preferably human. The AAV comprises a fiber protein that specifically or CC selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a CC fiber protein from an adenovirus type D subgroup or is a chimeric protein CC containing a portion of the N-terminus of an adenovirus type 2 or type 5 cc penton, and the therapeutic product is a trophic factor, an anti-CC apoptotic factor, gene encoding a rhodopsin protein, a wild-type CC stargard disease gene (STDG1), an anti-cancer agent and a protein that CC regulates expression of a photoreceptor specific gene product. The viral nucleic acid of AAV comprises ITRS and packaging signal derived from AAV comprises a feet therapy, where the vector comprises an AV type 37 fiber CC protein or its portion, and selectively transduces photoreceptors and CC delivers a gene product encoded by AAV. The present sequence represents comprises in protein plasmid pEI/Fiber containing the adenovirus E1 and Fiber

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (bases 1 to 726)
challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; control 24 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; PMA 10 ng/ml, 3 hours; Staph aureus moi 10, 24 hours; Klebsiella moi 10, 3 hours; Staph aureus moi 10, 24 hours; Klebsiella vector (Ad5 CMV eGFP), moi 500, 3 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; Wt adenovirus moi 500, 3 hours; Wt adenovirus wt adenovirus + LPS 24 hours; Wt adenovirus + LPS 3 hours; Wt adenovirus + LPS 24 hours; Wt adenovirus + LPS 3 hours; Wt adenovirus + LPS 3 hours; Wt adenovirus + LPS 3 hours; Ad vector + LPS 3 hours; Ad vector + LPS 24 hours; Wt adenovirus + LPS 3 hours; Ht adenovirus + LPS 24 hours; Wt adenovirus hours; Nours; Nours; Adenovirus + LPS 3 hours; Ht adenovirus + L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /clome_lib="NCI_CGAP_FT1"

/note="Organ: Lung; Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site]: Econ I; Site_2: Not I; NCI CGAP FT1 is a normalized cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 24 hours; control 24 hours; LPS 100 ng/ml, 24 hours; Staph aureus moi 10, 3 hours; Klebsiella moi 10, 24 hours; Klebsiella moi 10, 3 hours; Klebsiella moi 10, 24 hours; Klebsiella moi 10, 3 hours; Klebsiella moi 10, 24 hours; Klebsiella vector (Ad5 CMV eGFP), moi 500, 3 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 3 hours; Adenovirus + LPS 3 hours; Ad adenovirus moi 500, 24 hours; Adenovirus + LPS 3 hours; Ad according to Bonaldo, Lennon and Sorres, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Duable stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT73-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GCCCANGCGG. The tissue was provided by Dr. Gary W.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vector (Ad5 CMV eGFP), moi 500, 3 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; wt adenovirus moi 500, 3 hours; wt adenovirus moi 500, 24 hours; wt adenovirus moi 500, 3 hours; ad vector + LPS 3 hours; ad vector + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours. The library was normalized according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an Ecox I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GGCCATGCCG. The tissue was provided by Dr. Gary W. Humninghake of the University of Iowa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the conditions, other macrophages in different conditions). The mRNA samples were pooled for library construction. Control 1 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; had no ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; klebsiella moi 10, 3 hours; Klebsiella moi 10, 24 hours; Klebsiella moi 10, 3 hours; Staph aureus moi 10, 24 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 3 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; wt adenovirus moi 500, 3 hours; had vector + LPS 3 hours; wt adenovirus moi 500, 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; had vector + LPS 3 hours; had vector + LPS 3 hours; had vector + LPS 3 hours; had adenovirus + LPS 24 hours. The library was normalized according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into prTTJ-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GCCANTCCG. The tissue was provided by Dr. Gary W. Hunninghake of the University of Iowa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        incubations following isolation by bronchoalveolar lavage)

Patent No. 595360

GENERAL INFORMATION:

APPLICANT: Chamberlain, Jeffrey S.
APPLICANT: Amalfitano, Andrea
APPLICANT: Hauser, Michael A.

APPLICANT: Hauser, Michael A.

APPLICANT: Hauser, Michael A.

APPLICANT: Hausers of Connor, Dennis J.

ITITLE OF INVENTION: IMPROVED ADENOVIRUS VE.

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSE: Medlen & Carroll, LLP

STREET: 220 Montgomery Street, Suite 220;

CITY: San Francisco

STATE: California

COUNTRY: United States Of America

ZIP: 94104

US-08-735-609-4
US-08-735-609-4
; Sequence 4, Application US/08735609
; Patent No. 5994132
; GENERAL INFORMATION:
; APPLICANT: Chamberlain, Jeffrey S.
; Amalfitano, Andrea
Hauser, Michael A.
;
COMPUTER: PARELE FORM:

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOPTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION NUMBER: US/08/735,609
FILING DATE: 23-Oct-1996
CLASSIFICATION: <Unknown>
ATTORNEY/AGENT INFORMATION:
NAME: Ingolia, Diane E.
REGISTRATION NUMBER: UM-027
REFERENCE/DOCKET NUMBER: UM-027
REFERENCE/DOCKET NUMBER: UM-02484
TELECOMMUNICATION INFORMATION:
TELEPAX: (415) 397-8338
INFORMATION FOR SEQ ID NO: 4:
SEQUENCE CHARACTERISTICS:
LENGTH: 34303 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: other nucleic acid
DESCRIPTION: /desc = "DNA"
SEQUENCE DESCRIPTION: SEQ ID NO: 4:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4893

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 15, Application US/09482682

Publication No. US20030157688A1

GENERAL INFORMATION:

APPLICANT: VON SEGGERN, DANIEL

APPLICANT: NEMEROW, GLEN R.

APPLICANT: HALLENBECK, PAUL

APPLICANT: SKRIPCHENKO, YELENA

TITLE OF INVENTION: AND METHODS FOR PREPARATION AND USE

FILE REFERENCE: 1294.001001

CURRENT APPLICATION NUMBER: US/09/482,682

CURRENT APPLICATION UNUMBER: US/09/482,682

CURRENT FILING DATE: 2000-01-14

NUMBER OF SEQ ID NOS: 76

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 15

LENGTH: 14455

TYPE: DNA

ORGANISM: Artificial Sequence

Sequence 4, Application US/09782378A

Patent NO. US20020102731A1

GENERAL INFORMATION:
APPLICANT: Hearing, Patrick
APPLICANT: Bahou, Wadie
APPLICANT: Sandalon, Ziv
APPLICANT: Gnatenko, Dmitri
TITLE OF INVENTION: Adenoviral Vectors
FILE REFERENCE: STONYB-04970

CURRENT APPLICATION NUMBER: US/09/782,378A

CURRENT FILING DATE: 2001-02-12

PRIOR FRILMG DATE: 2001-02-12

PRIOR PRILMG DATE: 2000-10-02

NUMBER OF SEQ ID NOS: 27

SOFTWARE: Patentin version 3.0
